Classy People 👩‍💻

Let's start exploring **classes** by making a very simple one to represent a person.

Your task:

1. Create a class called `Person`
2. Add two properties:
   - `FirstName` (string)
   - `LastName` (string)
3. Add a read-only property:
   - `FullName` → returns `"FirstName LastName"`
4. Add a **default constructor** that sets:
   - `FirstName = "Jane"`, `LastName = "Smith"`
5. Add an **overloaded constructor** that lets you set the first and last name

Example Usage

```
Person p1 = new Person();
Console.WriteLine(p1.FullName); // Jane Smith

Person p2 = new Person("Marcus", "Nguyen");
Console.WriteLine(p2.FullName); // Marcus Nguyen
```

Reminders

- Use `public string FirstName { get; set; }`
- Use a read-only property: `public string FullName => ...`
- Constructors look like:

```
public Person() { ... }

public Person(string first, string last) { ... }
```

Bonus (Optional)

Add a method called `SayHello()` that prints:

```
Hello, my name is Marcus Nguyen
```
